Project Initiation: 2008

Absolute Mobile Solutions Delivers Project Time

In 2008 Absolute IT Solutions realized the need for their developers to have remote mobile access to the corporate time tracking solution. In the past, developers used a website or an offline workbook to capture their time. As the company grew, more and more resources found themselves in a position where they were performing project related tasks without internet access or their workbook readily available. These developers would often record their time in notebooks which proved unreliable as Absolute IT Solutions customers required current time data which often did not include offline manually recorded data. A mobile solution was needed and as Absolute IT Solutions did not control the mobile devices of its developers, the solution would have to be implemented on multiple platforms including Symbian S60, Windows Mobile, iPhone, and RIM BlackBerry.

About Project Time

Absolute Project Time allows users to record start and end times as well as project, module, and description for project work. All time entries are submitted to the Absolute IT Solutions Time Tracker server. Detailed reports can be generated for customers.
